D680 Series
Mini Direct Drive Valve Piloted
Servo-Proportional Control Valves
with Integrated Electronics
ISO 4401 Size 05 to 08
MOOG SERVO-PROPORTIONAL CONTROL VALVES

For over 25 years Moog has manufactured proportional control valves with integrated electronics. During this time over 150,000 valves have been delivered. These proportional control valves have been proven to provide reliable control of including injection and blow molding equipment, die casting machines, presses, heavy industry equipment, paper and lumber processing and other applications.

D680 SERIES SERVO-PROPORTIONAL CONTROL VALVES

The D680 Series Direct Drive Piloted Servo-Proportional Control Valves are throttle valves for 2-, 3-, 4- and 5-way applications. These valves are suitable for electrohydraulic position, velocity, pressure or force control systems including those with high dynamic response requirements.

The D680 Series, is a line of direct-drive piloted valves that complement the company’s D660 Series ServoJet models.

Like all Moog DDVs, this DDV pilot has a permanent magnet linear force motor that operates the spool directly.

The D680 Series offers these improvements:
- Reduced pilot stage leakage to save energy
- Dynamic performance less dependent on system pressure levels
- Faster step and frequency response to increase system dynamics

The D680 Servo-Proportional Control Valves are equipped with the company’s newly developed integrated 24V DC electronics with a pulse-width modulated current driver.

The line’s many safety characteristics include enabled signal for the supply voltage, release confirmation, supply voltage monitoring and failsafe spool position confirmation. The two-stage D680 comes in three sizes, which correspond to ISO 4401 sizes 05, 07 and 08. Flow ranges are from 8 gpm to 145 gpm [30 to 550 l/min] at 150-psi [10 bar] drop, while the valves are designed to operate with up to 5,000-psi [345 bar] system pressure.

Fail-safe Option

D680 valves are available with either a mechanical or electrically controlled fail-safe option. Certain conditions must exist for the fail-safe to work reliably. See the type designation section for fail-safe (page 22) and technical data for fail-safe versions (page 18) for more information.

Our quality management system is certified in accordance with DIN EN ISO 9001.

The valve series described in this catalogue have successfully passed EMC tests required by EC Directive. Please refer to the respective references in the electronics section.

This catalogue is for users with technical knowledge. To ensure that all necessary characteristics for function and safety of the system are given, the user has to check the suitability of the products described herein. In case of doubt please contact Moog.
Flexible Design Elements Optimize the Valve to Your Application
The D680 Series Proportional Control Valves are of two-stage design. By combining a fast first stage, a suitable spool drive area and integrated electronics, an optimum proportional valve can be offered.

Highest Flow Capability for High Velocity Applications
The D07 and D08 (NG 16 to NG 25) D680 Series valves offer the highest flow per body size.

Reduced Spool Drive Area for Improved Dynamic Response
The D08 (NG 25) D683 and D684 Series valves are available with a stub shaft spool for higher valve dynamic.

Fail-Safe Versions for Defined Spool Position at Loss of Power
Mechanical and electrically controlled fail-safe versions provide defined safe spool position by a spring and/or a poppet valve, and/or by external hydraulic supply cut off.

High Dynamics and Higher Flow Capability of Direct Drive Pilot Valve for Highest Dynamic Valve Design.
The high natural frequency of the Direct Drive pilot stage (300 Hz ± 10%) in conjunction with its high flow capability results in one of the highest dynamic servo-proportional valves on the market.

Direct Drive Pilot Valve for Dynamic Performance Independent of System Pressure
The electro-mechanical design of the direct drive pilot valve results in dynamic performance of the valve that is nearly independent of system pressure.

High Pressure Gain of Direct Drive Pilot Valve for Reliable Operation
The pilot valve’s high pressure gain improves the spool driving forces of the main stage. This ensures enhanced main stage spool position control even in situations with high internal flow forces and contaminated fluids.

Improved Resistance to Contamination Reduces Down Time
The Direct Drive pilot stage valves have high spool driving forces offering greater chip shearing forces, making the valve more tolerant to contamination.

2-Stage Proportional Control Valve
OPERATING PRINCIPLE OF THE DIRECT DRIVE PILOT STAGE

The D633 Series pilot valve consists of a permanent magnet linear force motor, a drive rod connecting motor armature and the spool, guided within a bushing. The linear force motor contains a coil, permanent magnets, pole pieces, an armature and a centering spring. The 4-way spool controls fluid flow from the pressure port to one of the load ports and also from the other load port to return. Deflection of the centering spring, due to spool displacement, provides a return force for the armature. An electric current applied to the coil of the linear force motor produces an electromagnetic flux dependent on the current polarity and amplitude. This electromagnetic flux is superimposed on the permanent magnetic flux in the airgaps between armature and pole pieces. This results in a polarity dependent displacement of the armature against the centering spring force. The spool being connected to the armature by a rod shares the armature motion. Flow forces acting on the spool due to the fluid flow through the valve and friction forces between spool and bushing due to contaminated fluid are also overcome by the force motor. The position of the spool is approximately proportional to the coil current. Spring force and motor force work together in the same direction when the valve spool travels back to center position. At centered position the linear force motor requires no current.

Hydraulic symbol:
Symbol shown with pilot pressure and electric supply on and zero command signal.

OPERATING PRINCIPLE OF THE TWO-STAGE VALVE

The main stage spool position control loop, consisting of main stage spool, position transducer and pilot valve, is closed by the integrated electronics. An electric command signal (flow rate set point) is applied to the integrated position controller which drives the current in the pilot valve coil. The position transducer (LVDT) which is excited via an oscillator measures the position of the main spool (actual value, position voltage). This signal is then demodulated and fed back to the controller where it is compared with the command signal. The controller drives the pilot valve until the error between command signal and feedback signal is zero. Thus the position of the main spool is proportional to the command signal.

Hydraulic symbol:
Symbol shown with pilot pressure and electric supply on and zero command signal.
A valve's flow is dependent upon its electrical command signal and valve pressure drop. The flow for a given valve pressure drop can be calculated using the square root function for sharp edged orifices as follows:

\[ Q = Q_N \frac{\sqrt{\Delta p}}{\Delta p_N} \]

- \( Q \) [gpm] = calculated flow
- \( Q_N \) [gpm] = rated flow
- \( \Delta p \) [psi] = actual valve pressure drop
- \( \Delta p_N \) [psi] = rated valve pressure drop

If large flow rates with high valve pressure drop are required an appropriate higher pilot pressure has to be selected in order to overcome the flow forces. An approximate value can be calculated as follows:

\[ P_X \geq .012 \frac{Q}{A_e} \sqrt{\Delta p} \]

- \( Q \) [gpm] = max. flow
- \( \Delta p \) [psi] = valve pressure drop with \( Q \)
- \( A_e \) [in²] = spool drive area
- \( P_X \) [psi] = pilot pressure

The pilot pressure \( P_X \) has to be at least 215 psi [15 bar] above the return pressure of the pilot stage.

---

PERFORMANCE SPECIFICATIONS FOR STANDARD MODELS

**Operating pressure Range**
- Ports P, A and B: up to 5,000 psi [350 bar]
- Port T: see data of individual series

**Temperature Range**
- Ambient: -4 °F to +140 °F [-20°C to +60°C]
- Fluid: -4 °F to +176 °F [-20°C to +80°C]

**Seal Material**
- NBR, FPM and others on request

**Operating Fluid**
- Mineral oil based hydraulic fluid (DIN 51524, part 1 to 3), other fluids on request

**Viscosity**
- Recommended: 15 to 45 centistrokes
- Allowable: 5 to 400 centistrokes

**System Filtration**
- Pilot stage or pilot valve: high pressure filter (without bypass, but with dirt alarm) mounted in the main flow and if possible directly upstream of the valve.
- Main stage: high pressure filter as for the pilot stage. When used in combination with a fast regulating VD-pump a bypass filter is recommended.

**Class of Cleanliness**
- The cleanliness of the hydraulic fluid greatly effects the performance (spool positioning, high resolution) and wear (metering edges, pressure gain, leakage) of the valve.

**Recommended Cleanliness Class**
- For normal operation: ISO 4406 < 16 / 13
- For longer life: ISO 4406 < 14 / 11

**Filter Rating**
- Recommended
  - For normal operation: \( \beta_{10} \geq 75 \) (10 µm absolute)
  - For longer life: \( \beta_{10} \geq 75 \) (6 µm absolute)

**Installation Options**
- Any position, fixed or movable

**Vibration**
- 30 g, 3 axes

**Degree of Protection**
- EN60529: class IP 65, with mating connector mounted

**Shipping Plate**
- Delivered with an oil sealed shipping plate under the mounting surface.
GENERAL REQUIREMENTS FOR VALVE ELECTRONICS

➤ Supply 24 VDC, min. 18 VDC, max. 32 VDC. Current consumption max. 800 mA
➤ All signal lines, also those of external transducers, shielded
➤ Shielding connected radially to \(0\) V, power supply side and connected to the mating connector housing (EMC)
➤ **EMC**: Meets the requirements of EN 55011:1998 class B, EN 50082-2:1995, performance criteria class A
➤ Protective grounding lead \(\geq 0.75\) mm\(^2\)[18 AWG]
  Consider voltage losses between cabinet and valve.
➤ Note: When making electrical connections to the valve (shield, protective earth), appropriate measures must be taken to ensure that locally different earth potentials do not result in excessive ground currents. See also Moog Application Note AM 353 E.
VALVE ELECTRONICS WITH SUPPLY VOLTAGE 24 VOLT AND 6+PE POLE CONNECTOR

Command signal 0 to ±10 mA floating,
Valves with current command input
The spool stroke of the valve is proportional to ID = –IE. 100 % valve opening P A and B T is achieved at ID = +10 mA. At 0 mA command the spool is in its center position. The input pins D and E are inverting. Either pin D or E is used according to the required operating direction. The other pin is connected to signal ground at cabinet side.

Command signal 0 to ±10 V,
Valves with voltage command input
The spool stroke of the valve is proportional to (UD – UE). 100 % valve opening P A and B T is achieved at (UD – UE) = +10 V. At 0 V command the spool is in its center position. The input stage is a differential amplifier. If only one command signal is available, pin D or E is connected to signal ground at cabinet side, according to the required operating direction.

Actual value 4 to 20 mA
The actual spool position value can be measured at pin F (see diagram below). This signal can be used for monitoring and fault detection purposes. The spool stroke range corresponds to 4 to 20 mA. The centred position is at 12 mA. 20 mA corresponds to 100 % valve opening P A and B T.

The position signal output 4 to 20 mA can be used to detect a cable break when IF = 0 mA.

For failure detection purposes it is recommended to connect pin F of the mating connector and route this signal to the control cabinet.

VALVE ELECTRONICS WITH SUPPLY VOLTAGE 24 VOLT AND 11+PE POLE CONNECTOR

Command signal
0 to ±10 mA floating. Valves with current command input
The spool stroke of the valve is proportional to \( I_4 = -I_5 \). 100 % valve opening \( P \leq A \) and \( B \leq T \) is achieved at \( I_4 = +10 \) mA. At 0 mA command the spool is in its center position. The input pins 4 and 5 are inverting. Either pin 4 or 5 is used according to the required operating direction. The other pin is connected to signal ground at cabinet side.

Actual value 4 to 20 mA
The actual spool position value can be measured at pin 6 (see diagram below). This signal can be used for monitoring and fault detection purposes. The spool stroke range corresponds to 4 to 20 mA. The centred position is at 12 mA. 20 mA corresponds to 100 % valve opening \( P \leq A \) and \( B \leq T \).

Valve Ready
\( U_{12} > 8.5 \) VDC. Enable and supply ok
\( U_{12} < 6.5 \) VDC. Not enabled or supply not ok
Output \( I_{max} \): 20 mA

For failure detection purposes it is recommended to connect pin 6 of the mating connector and route this signal to the control cabinet.

Command signal
0 to ±10 V. Valves with voltage command input
The spool stroke of the valve is proportional to \( (U_4 - U_5) \). 100 % valve opening \( P \leq A \) and \( B \leq T \) is achieved at \( (U_4 - U_5) = +10 \) V. At 0 V command the spool is in its center position. The input stage is a differential amplifier. If only one command signal is available, pin 4 or 5 is connected to signal ground at cabinet side, according to the required operating direction.

FAIL-SAFE VALVE ELECTRONICS WITH SUPPLY VOLTAGE 24 VOLT AND 11+PE POLE CONNECTOR

Command signal
0 to ±10 mA floating, Valves with current command input
The spool stroke of the valve is proportional to I4 = -I5.
100 % valve opening P • A and B • T is achieved at I4 = +10 mA.
At 0 mA command, the spool is in its center position. The input pins 4 and 5 are inverting. Either pin 4 or 5 is used according to the required operating direction. The other pin is connected to signal ground at cabinet side.

Command signal
0 to ±10 V Valves with voltage command input
The spool stroke of the valve is proportional to (U4 – U5). 100 % valve opening P • A and B • T is achieved at (U4 – U5) = +10 V. At 0 V command the spool is in its center position. The input stage is a differential amplifier. If only one command signal is available, pin 4 or 5 is connected to signal ground at cabinet side, according to the required operating direction.

Actual value 4 to 20 mA
The actual spool position value can be measured at pin 6 (see diagram below). This signal can be used for monitoring and fault detection purposes. The spool stroke range corresponds to 4 to 20 mA. The centred position is at 12 mA. 20 mA corresponds to 100 % valve opening P • A and B • T.

The position signal output 4 to 20 mA allows to detect a cable break when I6 = 0 mA.

For failure detection purposes it is advised to connect pin 6 of the mating connector and route this signal to the control cabinet.

* measured at 3,000 psi [210 bar] pilot or operating pressure, respectively, fluid viscosity of 32 mm²/s and fluid temperature of 104°F [40°C]

PERFORMANCE SPECIFICATIONS FOR STANDARD MODELS

Flow vs. Signal Curve
at ΔPn = 75 psi [5 bar] per land

Spool version A: ~critical lap, linear characteristic (21)
Spool version D: 10% overlap, linear characteristic
Spool version Y: ~critical lap, curvilinear characteristic (21)

Typical characteristic curves measured at 3,000 psi [210 bar] pilot or operating pressure, fluid viscosity of 32 mm²/s and fluid temperature of 104°F [40°C]
The mounting manifold must conform to ISO 4401-05-05-0-94.
Attention: Notice O-ring recess dia of X and Y ports. For valves in 4/3-way version with QN > 16 gpm [60 l/min] and in 2 x 2-way version the non standard 2nd return port T2 must be used. With 5-way version the P and T ports are interchanged, i.e. T changes to P, T2 changes to P2 and P changes to T.

For maximum flow the manifold ports P, T, A and B require to have Ø .45 in [Ø 11.5 mm] (deviation from standard). Mounting surface needs to be flat within .0004 in [0.01 mm] over a distance of 3.9 in [100 mm]. Average surface finish value, Ra, better than 32.

* measured at 3,000 psi [210 bar] pilot or operating pressure, respectively, fluid viscosity of 32 mm²/s and fluid temperature of 104°F [40°C]

### Flow vs. Signal Curve

- **A**: ~critical lap, linear characteristic
- **D**: 10% overlap, linear characteristic
- **Y**: ~critical lap, curvilinear characteristic

Typical characteristic curves measured at 3,000 psi [210 bar] pilot or operating pressure, fluid viscosity of 32 mm²/s and fluid temperature of 104°F [40°C]

---

**PERFORMANCE SPECIFICATIONS FOR STANDARD MODELS**

- **4-way version**
  - Optional: X and Y external
  - No fail-safe position

- **2 x 2-way version**
  - Optional: X and Y external
  - Fail-safe centered position by mechanical spool stop

---

**Flow vs. Signal Curve**

- **A**: ~critical lap, linear characteristic
- **D**: 10% overlap, linear characteristic
- **Y**: ~critical lap, curvilinear characteristic

Typical characteristic curves measured at 3,000 psi [210 bar] pilot or operating pressure, fluid viscosity of 32 mm²/s and fluid temperature of 104°F [40°C]
The mounting manifold must conform to ISO 4401-07-06-0-94.

For maximum flow the manifold ports P, T, A and B require to have Ø 0.79 in [Ø 20 mm] (deviation from standard).

Mounting surface needs to be flat within .0004 in [0.01 mm] over a distance of 3.9 in [100 mm]. Average surface finish value, Ra, better than 32.

Moog • D680 Series 17
OPERATING PRINCIPLE OF THE FAIL-SAFE VALVE

Application safety is dependent on the application itself, local safety requirements and design preferences. For applications where certain safety regulations are applicable, a defined metering spool position is needed in order to avoid potential damage. Various fail-safe versions are available for Moog servo-proportional control valves. To define the fail-safe version in a D680 Series Valve, a complete understanding of the hydraulic circuit and country specific safety regulations is required.

With fail-safe valves it is possible to check whether the main spool is in its predefined position. If the main spool is within its defined range, the logic output signal at pin 11 is > + 8.5 V. If this signal is < + 6.5 V, then the main spool is outside the defined range. This logic signal may be delayed up to 500 ms. To reduce the fail-safe switching time it is advised to both switch off the supply of the 4/2-way valve and the enable signal at the same time.

The following information applies to W, U and V electrically controlled fail-safe functionality. Contact Moog for additional information.

Fail Safe Functionality
After switching off the 24 V supply to the safety solenoid valve, this fail-safe function creates a defined metering spool position: overlapped centered position or fully opened A T.

Fail-Safe Version W or U
In order to move the spool to the safe centered position with D680 Series fail-safe valves, the two control chambers of the main stage are hydraulically short circuited by a 4/2-way solenoid valve. The spring force moves the spool into the overlapped centered position.

Fail-Safe Version V
In order to reach the fully opened position A T with D680 Series fail-safe valves, the spring force (after the control chambers have been short circuited) pushes the spool to the end position A T.

D683 Series Two-stage Proportional Control Valve with D633 Series pilot valve and 4/2-way solenoid valve for the Fail-safe version

Hydraulic symbol:
Symbol shown with pilot pressure and electric supply on and solenoid off.

Note:
According to EN 954-1, a higher safety category can be achieved if a fail-safe valve is used.
